Summary

The September 2026 rainfall report from Boquete Weather Watchers (boqueteweather.com) shows totals ranging from 5.18 inches at Palmira Arriba to 29.97 inches at Brisas Boquetenas. Volunteer stations across Boquete district contributed the measurements.

Details (summary of the article)

Boquete Weather Watchers, the volunteer rain-gauge network run through boqueteweather.com, published its September 2026 summary. The wettest readings came from Brisas Boquetenas with 29.97 inches and Jaramillo Abajo with 29.23 inches, with Jaramillo Alto also high at 30.63 inches; the driest was Palmira Arriba at just 5.18 inches. Year-to-date totals vary widely, from about 38 inches at El Salto Arriba and Palmira Arriba to more than 100 inches at Palo Alto and Brisas Boquetenas. At the Palmira Arriba station September's 5.18 inches is far below the 20-year September average of 20.23 inches, making it the driest September on record there (the wettest was 46.00 inches in 2010). That station recorded rain on 20 days, average winds of 3.63 mph mostly from the north-northeast with a gust of 25.8 mph, and temperatures between 61.2 and 71.3 degrees F. Forecasters note a strengthening El Niño, with international models giving a 40-60% chance of below-normal rain in Panama for October through December, though Panama's IMHPA expects near or above normal rainfall in the Chiriqui highlands during October. Coffee harvesting in the district has begun.
